

WHITE PAPER

How Bottleless Water Coolers Help Businesses Cut Costs, Improve Sustainability, and Enhance Employee Wellness

This paper discusses the reasons behind the growing trend of organizations switching from bottled to filtered water coolers. Also called "point-of-use" or "bottleless" coolers, filtered water coolers compress the sophisticated purification technology of a filtration plant into an appliance the size of a traditional bottled water cooler, which can be placed anywhere in the workplace. The key drivers behind the switch to filtered water coolers fall into 3 categories: cutting costs, improving sustainability, and enhancing employee wellness.

Traditional office water coolers, with their bulky 5-gallon plastic jugs, are rapidly being replaced by filtered water coolers. The global home water filtration unit market is expected to grow at a compound annual growth rate of 15.9% from 2019 to 2025 to reach USD 24.11 billion by 2025.¹ Following is a detailed analysis of the 3 main benefits reported by companies after having upgraded to filtered water coolers.

3 REASONS TO UPGRADE YOUR WATER COOLER(S) IMMEDIATELY

Cut Costs

Eliminating the costs of water delivery provides savings for all workplaces from Wall Street to Main Street! In fact, the larger the workplace (and the more bottles consumed), the greater the savings. Freeing workers from managing plastic jug inventory also leads to savings in the form of productivity gains.

Improve Sustainability

Just one bottleless water cooler can keep 7,000 plastic bottles or 150 5-gallon jugs out of the environment every year.² Thus, filtered water coolers provide organizations with one of the few opportunities to reduce their environmental footprint while also saving money.

Enhance Employee Wellness

Bottleless water coolers use state-of-the-art filtration technology to improve water quality. Conversely, bottled water coolers require an extensive and frequent cleaning regimen to maintain similar levels of cleanliness.

1. Cut Costs

AVOID THE STAGGERING MARKUP ASSOCIATED WITH PLASTIC JUG DELIVERY.

Considering the numerous costs passed along the water delivery supply chain to the end user, it is easy to understand why water delivery is so expensive and why filtered water coolers provide a more cost-effective solution (See Fig. 1). If your office pays for water delivery, you are subsidizing:

- The costs associated with manufacturing plastic jugs and filling them with water at bottling plants;
- The cost of shipping 5-gallon water jugs from the bottling plant to distribution centers; and
- Fuel and labor costs of delivery trucks hauling jugs from the distribution center to your workplace.

The Natural Resources Defense Council estimates that “90 percent or more of the cost paid by bottled water consumers goes to things other than the water itself – bottling, packaging, shipping, marketing, retailing, other expenses, and profit.”³

Eliminating water delivery can significantly reduce your business

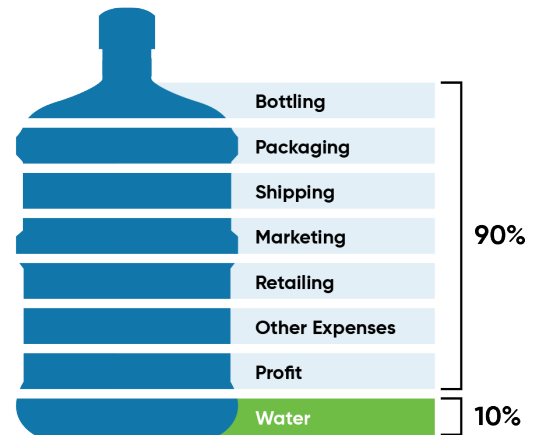

Figure 1: Breakdown of bottled water costs

SOURCE: Natural Resources Defense Council

expenses. What more, your cost savings will continue to increase as your number of daily users increases. In fact, businesses with large facilities and hundreds of daily users, like airports or manufacturers, often save thousands of dollars a month on their drinking water expenses when they switch from traditional water delivery to bottleless water coolers.

Research shows that businesses can save up to 80% by switching from bottled water coolers to filtered coolers.⁴

INCREASING EMPLOYEE PRODUCTIVITY

In addition to the costs outlined above, there are hidden costs associated with water delivery service – namely, the cost of employees devoting time to managing your organization’s plastic jug inventory.

Managing water delivery service is time consuming. Large organizations wrestle with the logistics of keeping track of plastic jugs, knowing the exact location of each cooler, and reordering jugs to prevent running out of drinking water.

Further complicating matters, the number of jugs used on a monthly basis can be quite different due to seasonality. The Accounts Payable department must try to make sense of invoices that vary each month and ensure the number billed for is the same as the number delivered.

Each time additional bottles are delivered to a location, someone needs to meet and, often, escort or supervise the delivery person. Eliminating bottles also means fewer people coming in and out of your building, which lowers the risk of spreading COVID and other diseases.

USING OFFICE SPACE MORE EFFECTIVELY

Office space is expensive. Average listing rate nationwide of \$38.62 per square foot in Feb ‘22 and \$83.52 in NYC.⁵

The average nationwide listing rate in February of 2022 was \$38.62 per square foot, and \$83.52 per square foot in New York City. Large, 5-gallon containers of water occupy valuable real estate for storage of jugs. Imagine the other ways these spaces could be used if they did not have to house dozens of 43-pound jugs (both empty and full).

2. Improve Sustainability

WATER DELIVERY HAS A MASSIVE ENVIRONMENTAL FOOTPRINT.

The water delivery lifecycle consumes energy, burns fossil fuel, and overruns landfills with plastic that never gets recycled. Each year, the production and delivery of 5-gallon plastic jugs:

- **Consumes 140 million kilowatt hours of electricity** – A staggering amount of power is needed to manufacture plastic jugs, fill them with 5 gallons of water, store them, and transport them from facility to facility. Companies that replace 5-gallon water jugs with bottleless water coolers are responsible for the emission of 53% fewer tons

Cost per Month: Filtered Water vs. Water Delivery

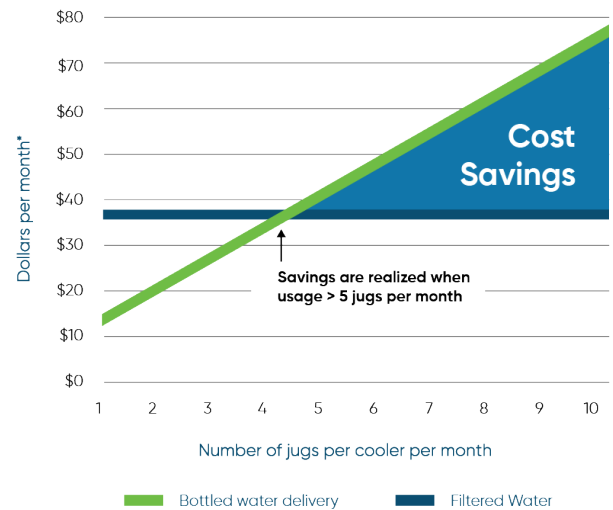

Table 1: Organizations can realize significant cost savings with filtered water coolers.

** Assumes \$6/month cooler rental with constant \$7/jug water cost (no volume discount) SOURCEL L.E.K. interviews and Analysis*

An endless water supply eliminates the need to spend time tracking jug inventory, chaperoning deliveries, and hoisting 43-pound jugs of water out of storage and onto water coolers.⁶

of CO₂ every year (for an office of 50 daily users). Companies that replace single-use plastic bottles with bottleless water coolers are responsible for the emission of 95% fewer gallons of CO₂ every year (for an office of 50 daily users).

- **Burns 6 million gallons of fuel⁷** – And releases approximately 2.5 million tons of CO₂ into the atmosphere. So, even if you recycle, production of plastic containers will still cause a negative impact on the environment.
- **Adds over 70 million pounds of waste to landfills²** – Evidence suggests that as much as 80% of all plastic water jugs end up in landfills. Additionally, industrial waste from bottle manufacturing and packaging are also found in landfills. Just one filtered water cooler can keep 7,000 plastic bottles or 150 5-gallon water jugs out of the environment every year.
- **Wastes a gallon of water for every gallon of water that is bottled** – It takes 2 to 5 jugs of water to manufacture a plastic jug, including all the process steps to extract the petroleum, make the plastic, and form the bottle. Another bottle's worth of water is then consumed to fill the plastic bottles – i.e. to generate power, wash used bottles before re-use, and other aspects of the bottling process.

It is easy to see how, on an individual office/workplace level, participating in the water delivery supply chain increases a firm's carbon footprint⁹. Switching to filtered water coolers – with their continuous water supply – takes your business off of the water bottle truck's delivery route.

In stark contrast to the strain placed on the environment by the plastic water jug delivery service, filtered water coolers have a positive impact. The filtered water cooler industry has saved tens of thousands of metric tons of greenhouse gas emissions by replacing bottled water coolers. Millions of 5-gallon plastic jugs have been kept out of landfills, and enough fuel has been saved from water delivery to drive a bottled water delivery truck around the world thousands of times.

Increasingly, companies are being asked to incorporate sustainable business practices into their decisions. By replacing bottled water coolers with eco-friendly filtered water coolers, they can improve the environment.

- Does not require major infrastructure changes;
- Is cost-effective; and
- Provides immediate efficiency and sustainability gains.

Eliminating the greenhouse gas emissions from water delivery is an easy step to take when facility managers are asked to do their part for a company's sustainability efforts.

Figure 2: The bottled water delivery lifecycle squanders natural resources.

All told, the filtered water cooler industry has had the same impact on greenhouse gas reduction as planting millions of trees all over the world.⁸

3. Enhance Employee Wellness

KEEPING BOTTLED WATER COOLERS CLEAN AND SANITARY IS LABOR INTENSIVE AND IMPRACTICAL.

Plastic jug water coolers are open systems – in other words, they constantly interact with their environment and are thus vulnerable to bacterial growth. For example, humans must replace bottles when they become empty, allowing air to come in contact with the inside of the cooler.

When people replace the bottles, they add germs or bacteria to the water supply when handling the top of the bottle. Similarly, there are microbiological contaminants in the air that can come into contact with the water supply, resulting in bacteria growth or other organic substances in the cooler well.

The ability for the open system water cooler to spawn microbe growth is an acknowledged problem. The International Bottled Water Association (IBWA) recommends that bottled water coolers be sanitized every 3 months with gloves and bleach¹⁰. Most businesses are too busy to maintain this regimen to ensure that the bottled water dispenser is bacteria-free, leading many companies to ask themselves, “Why pay the premium for bottled water coolers when they harbor microbes?”

By contrast, filtered water coolers maintain an internal water supply.

Quench uses LED UV-C in our machines to inactivate or kill microorganisms, without adding any chemicals, like chlorine, to the filtered water. Independent testing has concluded that UV technology can eliminate 99.9999% of bacteria, 99.9999% of viruses, and 99.9% of parasites, including cryptosporidium and giardia.

BPA ISSUES RAISE ADDITIONAL HEALTH CONCERNS.

There is growing concern about plastics that use the chemical bisphenol-A (BPA) as a stiffening agent. BPA has been linked to breast cancer, immune system damage, heart disease, and diabetes. Eight US states currently ban BPA in baby bottles, and Canada has declared BPA a toxic substance^{11,12}. Additionally, 17 more states and the District of Columbia are considering new legislation to ban BPA from baby bottles, infant formula packaging, receipt paper, and other products.¹³

Many bottled water providers use 5-gallon jugs that contain BPA. Since BPA can leach from plastic into the water supply, offices with plastic water jugs made from BPA are at risk of exposing workers to the controversial chemical.

FILTRATION AND quenchWATER+

Filtered water coolers that feature multiple kinds of filters can further safeguard employees and customers from impurities in drinking water. We deliver clean, great-tasting, quality water thanks to our full suite of point-of-use filtration and purification technologies that remove sediment, reduce chemical contaminants, and get rid of off-tastes and odors.

Figure 3: The type of ultraviolet bulb found in many filtered water coolers.

Many types of filtered water coolers sanitize your drinking water using internal ultraviolet light.

LIFTING 43-POUND PLASTIC JUGS PUTS UNNECESSARY STRAIN ON YOUR WORKFORCE.⁶

5-gallon water jugs weigh an astonishing 43 pounds. To put the weight of these plastic jugs in perspective, that’s the same weight as an 18-foot canoe! As simple as it may sound, the vast majority of workers who replace these jugs have no training on proper technique for heavy lifting and are in jeopardy of suffering a workplace injury. For most businesses, asking office employees to do this manual labor adds unnecessary risk to operating costs.

Filtered water coolers eliminate the effort needed to replace 5-gallon bottles. This allows firms to mitigate one source of workers’ compensation risk in their organizations.

Figure 4: 18-foot canoes and 5-gallon water jugs both weigh 43 pounds!

Conclusion: The Right Drinking Water Solution for Your Organization

Bottled water coolers can lead to numerous issues related to cost, environmental concerns, and health risks. Filtered water coolers, by contrast, are like having the convenience of a miniature water filtration plant in your workplace, filtering and purifying water directly from the building’s water lines.

As discussed above, organizations are increasingly making the switch to filtered water coolers in order to drive efficiencies, maintain employee health, and enhance sustainability initiatives, production, and delivery of 5-gallon plastic jugs:

Water Delivery Service vs. Filtered Water Coolers		
	WATER DELIVERY SERVICE	FILTERED WATER COOLERS
Cut Costs	<ul style="list-style-type: none"> • High costs that increase with consumption • Time lost spent managing inventory • Frequent office visits for bottle delivery • Space wasted by extra bottles 	<ul style="list-style-type: none"> • One monthly rate regardless of consumption • Low maintenance • One preventive maintenance visit per year • Space only needed for coolers themselves
Improve Sustainability	<ul style="list-style-type: none"> • Significant carbon footprint from fossil fuel emissions, excessive energy usage, and massive contribution to plastic in landfills 	<ul style="list-style-type: none"> • Eco-friendly solution that has had the same impact on greenhouse gas reduction as planting millions of trees all over the world⁸
Enhance Employee Wellness	<ul style="list-style-type: none"> • Risk of contaminants (i.e. germs, bacteria) • BPA in plastic¹¹ • Risk in carrying & lifting 43-pound jugs⁶ 	<ul style="list-style-type: none"> • Self sanitization • Stainless steel tanks • No risk since no lifting required

About Quench

Quench USA, Inc. offers bottleless, filtered drinking water solutions for healthy and environmentally conscious consumers outside the home, through direct sales and independent dealers across North America. Quench bottleless water coolers, ice machines, sparkling water dispensers, and coffee brewers purify a user's existing water supply to provide reliable and convenient filtered water to a broad mix of businesses, including government, education, healthcare, manufacturing, retail, hospitality, and other large commercial customers, including more than half of the Fortune 500. For more information, please visit quenchwater.com.
